A central diagram with 'OOPS' in the middle. Surrounding it are six colored hexagons: Encapsulation (blue), Abstraction (green), Polymorphism (red), Inheritance (pink), Class (dark blue), and Object (yellow).

The Java logo, featuring a blue coffee cup with a red flame and the word 'Java' in red.

Java Constructors

OOPS USING JAVA

1

ABESIT
COLLEGE OF ENGINEERING
CRC-Training

Constructor

- ❖ Constructors are **special methods** that **create and return** an object of the class in which they're defined.
- ❖ Let's Understand Constructors –

A diagram showing the process of creating a new bank account. It starts with the text 'Create new Bank Account' where 'new' is circled. An arrow points from this text to a dashed box containing three steps: 1. Assign an account number, 2. Issue a checkbook, and 3. Create online web account.

OOPS USING JAVA

2

Constructor

- ❖ Rules to remember
 - ❖ Constructors are special methods
 - ❖ Constructors have the same name as the class name
 - ❖ don't specify a return type

Syntax -

```
class_name(){  
    //Body of Constructors  
}
```

```
class Employee {  
  
    Employee () {  
        System.out.println("Constructor");  
    }  
}
```

OOPS USING JAVA

3

Types of Java constructors

There are two types of constructors in Java:

- ❖ Default constructor (no-arg constructor)
- ❖ Parameterized constructor

OOPS USING JAVA

4

Default constructor

- ❖ A constructor is called "Default Constructor" when it doesn't have any parameter.

Default Constructor →

```
class Employee {  
    Employee () {  
        System.out.println("Constructor");  
    }  
}
```

Parameterized constructor

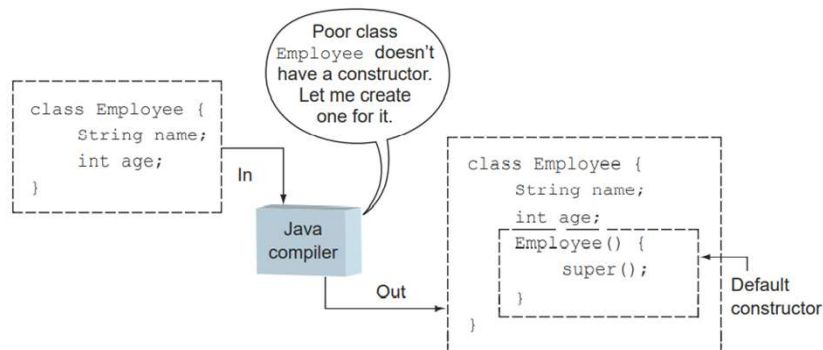

- ❖ A constructor which has a specific number of parameters is called a parameterized constructor.

Default Constructor →

```
class Employee {  
    String name;  
    int age;  
    Employee(int newAge, String newName) {  
        name = newName;  
        age = newAge;  
    }  
}
```

Constructor

What happens if you don't define any constructor in a class?

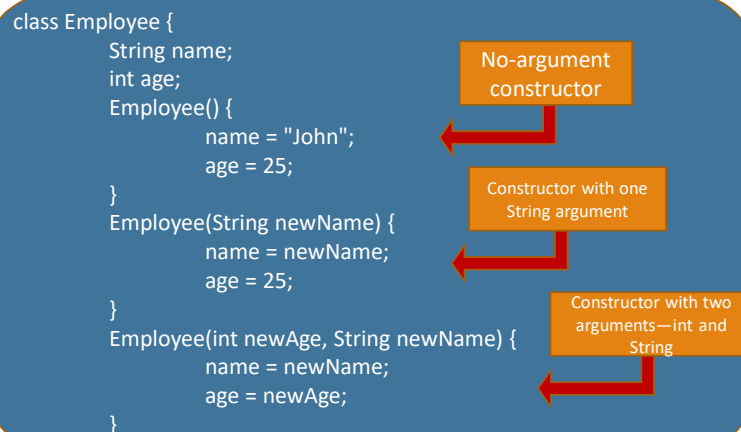

OOPS USING JAVA

7

Constructor Overloading

❖ Constructor overloading in Java is a technique of having **more than one constructor with different parameter lists**.

OOPS USING JAVA

8

What happens if you put “return-type” before any constructor in a class?

```
class Employee {  
  
    void Employee () {  
        System.out.println("Constructor");  
    }  
}
```

OOPS USING JAVA

9

this keyword

- ❖ This is a **reference variable** that refers to the current object
- ❖ Any object can use **this reference** to refer to its own instance.

OOPS USING JAVA

10

What if Instance Variable Name and local variable Name is/are the same in any Method?

```

1 class add{
2     int a,b;
3     add(int a, int b){
4         a=a;
5         b=b;
6     }
7 }
8
9 public class YourClassNameHere {
10     public static void main(String[] args) {
11         add a1 = new add(12,34);
12     }
13 }
  
```

OOPS USING JAVA

11

What if Instance Variable Name and local variable Name is/are the same in any Method?

```

1 class add{
2     int a,b;
3     add(int a, int b){
4         this.a=a;
5         this.b=b;
6     }
7 }
8
9 public class YourClassNameHere {
10     public static void main(String[] args) {
11         add a1 = new add(12,34);
12     }
13 }
  
```

OOPS USING JAVA

12

Invoking An Overloaded Constructor From Another Constructor

- ❖ A constructor is defined using the name of its class,
- ❖ it's a common mistake to try to **invoke a constructor** from another constructor using the **class's name**

```
class Employee {
    String name;
    int age;
    Employee() {
        Employee(null, 0);
    }
    Employee(String newName, int newAge) {
        name = newName;
        age = newAge;
    }
}
```

← **Won't compile—you can't invoke a constructor within a class by using the class's name.**

Invoking An Overloaded Constructor From Another Constructor

```
class Employee {
    String name;
    int age;
    Employee() {
        this(null, 0);
    }
    Employee(String newName, int newAge) {
        name = newName;
        age = newAge;
    }
}
```

1 **No-argument constructor**

2 **Invokes constructor that accepts two method arguments**

3 **Constructor that accepts two method arguments**

Can we call two (or more) constructors within a constructor ?

- ❖ We can't call two (or more) constructors within a constructor because the call to a constructor must be the first statement in a constructor.

```
class Employee {  
    String name;  
    int age;  
    Employee() {  
    }  
    Employee(String newName, int newAge) {  
        name = newName;  
        age = newAge;  
    }  
    Employee(String newName, int newAge, boolean create) {  
        this();  
        this(newName, newAge);  
        if (create)  
            System.out.println(10);  
    }  
}
```

← **Won't compile; can't include
calls to multiple constructors
in a constructor**
